CENTRAL FAX CENTER

FEB 08 2008

In the Claims

1. (currently amended) A system for distributing data comprising:

a) a data center database for storing and cataloging data representing pre-recorded movies, said data center containing a power source, a processor, a storage for containing said data, an input for adding data to said storage, and a communication device comprising a data center transmitter and a data center receiver;

b) a billing system connected to said database for selectively providing and controlling access to said data by assigning a unique pass code to a user upon making payment;

c) a plurality of users, each user having a display, an input remote control device, a processor, and a communication device comprising a user transmitter and a user receiver interface including means for requesting said data and means for viewing said data; and

d) a transmission network connected wirelessly to between each of said users independently user interface and to said data center, said transmission network comprising a processor and a communication device comprising a transmission network transmitter and a transmission network receiver, whereby an end user inputs a data request using said remote control device to said user processor, said user processor directing said user transmitter to transmit the data request to said transmission network receiver, said transmission network processor forwarding said data request to said data center receiver, said data center processor retrieving the data requested from said storage, said data center processor directing said data center transmitter to transmit the requested data to said transmission network receiver, said transmission network processor directing said transmission network transmitter to transmit the requested data to said user receiver, said user processor directing said display to show said requested data at a time selected by said end user, database for selectively transmitting said data therebetween, wherein upon said billing system providing access to a user, said requesting means generates a data request

~~for retrieving said data from said database for transmission of said data via said transmission network for viewing by said viewing means; and~~

e) said system allowing multiple users to simultaneously access data stored and catalogued in said data center.

2-5. (canceled)

6. (currently amended) The system as recited in claim 1 [[5]], wherein said input inputting means includes at least one of a DVD player, a MPEG player, a video cassette recorder, an internet connection, and an 8MM tape player.

7. (canceled)

8. (currently amended) The system as recited in claim 6 [[1]], wherein said transmission network is at least one of a cable television system, a satellite transmission system, a telephone network, and a fiber optic cable network.

9. (canceled)

10. (currently amended) The system as recited in claim 8 [[1]], wherein said display viewing means is at least one of a computer monitor and a television.

11-13. (canceled)

14. (currently amended) The system as recited in claim 10 [[1]], wherein said data represents movies filmed and produced in Asia.

15. (original) The system as recited in claim 14, wherein said data represents movies filmed and produced by Asian production companies.

16. (original) The system as recited in claim 15, wherein said data further includes at least one of full length motion pictures and mini-series programs having a predetermined number of parts associated therewith.
